

In today's CC, create a form which accepts the following details for a Dog object:

**Name, Age, Breed, Height, Weight, OwnerName**

Use appropriate data types for the above fields and send this data to your server.

In the server, save the incoming data in a json file and render a template to show the above accepted in a presentable manner using CSS. Use Bootstrap if you need to.

Note:

- Use templates for every view. No html file should be present in your project
- Do follow the usage directions for express-handlebars project and create proper directory structure.

Let me know if you have any doubts in **#ask\_instructor** channel.
