

For this assignment, you need to figure out how to store image in MongoDB itself. You will also be contributing to the [yelpcamp repository](#). This assignment builds upon [week-25 day-4 CC](#). Since you are accepting files in your server and moving it to a uploads folder, you need to explore a bit and find out ways to store it in DB rather than as a file.

One of the way is to store Buffer in the database.

Another way is to store base64 string in the database.

You can go for any one of the above approach or any other approach you might have.

It isn't mandatory to use only "express-fileupload", if you need to use "multer" or any other library, you can.

Do look into **#resources** channel for helpful content and ask any doubts in **#ask_instructor** channel.
