

In today's CC, we will add basic functionality to our Instagram mock up we made in our FE module.

Functionalities to add:

- Have basic authentication flow using **express-session** (do remember to add field for user avatar image), the design and routing of the login/signup form is up to you.
- When the user has logged in using your authentication flow, display the that user's profile in an instagram lookalike view. Initially the profile will not have any images uploaded.
- You will have to add a button in the profile area which will allow a logged in user to upload their images. Once the image is uploaded redirect the user to their profile page, which will show the uploaded image.

Note:

- You should use in memory user mock database so that you can host this on Heroku.
- Although, hosting is optional for this CC, but its recommended. If you decide NOT to host this CC, you can use file based JSON mock database.

Let me know if you have any doubts in **#ask_instructor** channel.
