

In today's CC, you will be creating a basic portfolio website. You'll have to use the combination of `express.static()` and `res.sendFile()` to achieve the below mentioned.

Firstly, you need to (at least) create 3 html files, `index.html`, `about.html` & `contact.html`

Add basic/dummy relevant content in all those HTML files. Also, add bootstrap's CSS to give a basic design to each of them. You can also add custom CSS of your own if needed and link it up accordingly as we have studied.

Secondly, in your Node.js project/server you need to specify the following routes accordingly.

GET

/

This route will show the content of `index.html`

GET

/about

This route will show the content of `about.html`

GET

/contact

This route will show the content of `contact.html`

Notice that the routes themselves don't have `/index.html` or `/contact.html`. Hence, serving all the files with just `express.static()` is not enough. As mentioned you'll have to use it with combination of `sendFile()`.

Note: All the HTML pages also need to mandatorily have links to all the other ones.

Let me know if you have any doubts in **#ask_instructor** channel.
