In today's CC, you will be contributing to the [yelpcamp repository](#).

Your task is to create a form for Campgrounds and save it's information into the database.

Create a route "**/campgrounds**" which displays a button, which on click, takes the user to "**/campgrounds/new**"

Create a route "**/campgrounds/new**" which displays a form for accepting Campground's data. The database fields should be **name, price, location, imageURL, description.**

You will need to use express-fileuploads to accept image file from the user and store its URL in the database in field **imageURL** as mentioned above.

After the data is saved in the database, redirect the user to the "**/campgrounds**" page.

Note:

1. You must use Mongoose models, to achieve the above task
2. Make use of dotenv to have the database url setup.
3. You must complete this task in a separate branch in your forked repo.
4. Do create a PR if you would like to add to your contribution to the main project.

Let me know if you have any doubts in **#ask_instructor** channel.
