In today's CC, create a University survey form and save all the responses into a json file.

For the questions, click here to get sample questions. Use these questions and design your own form and accept all the values from the client side and send it to your server. Save it to a file (JSON).

You have to accept the form data into your server such that the page never reloads/refreshes.

After sending the form data show the user an message in any way signifying whether the form data was saved or not. You can do this by checking the response coming back from your server.

You can design the form in anyway you like. You can use Bootstrap too.

Let me know if you have any doubts in **#ask_instructor** channel.
